

MySQL Capstone Project

Online Retail Sales Analytics Database

Database Design :

- The database is designed using 6 tables:
 1. customers
 2. products
 3. orders
 4. order_items
 5. payments
 6. deliveries
- Each table stores a separate type of business data to keep the database organized and reduce redundancy.
- Primary keys are used to uniquely identify each record in every table.

Table Relationships :

- One customer can place many orders, linked through customer_id.
- One order can contain many products through the order_items table.
- Payments and deliveries are connected to orders using order_id for tracking status and revenue.

Key Insights :

- Reports help analyze customers, revenue, order status, payment status, and delivery performance.
- The queries can identify high-revenue customers, popular product categories, and city-wise sales trends.
- Data quality queries help find failed payments, pending deliveries, and missing records.
